

Mobile coverage

Mobile coverage as a service – better coverage at work

With more companies switching to mobile solutions, the demand for coverage to function at all times is also increasing.

Better indoor coverage with repeater solution

For various reasons, mobile coverage does not always function as it should indoors – and it can lead to lost business. We therefore offer the Mobil Inomhustäckning service, which means that we install repeater equipment which redirects and distributes the radio signals in your office.

This is how it works

We first identify where in the property you want to have better coverage and which operator you want to use. We then measure both indoors and outdoors so that we can produce a design proposal and a quotation. When the order has been placed we agree on when the installation is to be performed. Obviously, we provide continuous support and service during the process.

Mobile coverage Standard

The standard package includes a 3G repeater for small premises. It is possible to adapt it for all operators and it can be reconfigured when you change operator – but it must always be adapted to a specific operator. It can be expanded with more internal aerials if necessary. This repeater is suitable for premises with open areas of up to approximately 500 square metres and about 12 users at the same time.

Mobile coverage Plus

The plus package includes a fully automatic and easy-to-use band selective 3G repeater for the 2100 MHz band. This repeater covers up to about 3,000 square metres and has capacity for about 50 users at the same time. Perfect for an office, house, small industrial building or warehouse etc. Also available for GSM 900 and 1800. This repeater solution can be adapted for several operators at the same time.

Five benefits of Mobile indoor coverage

- Improved signal strength
- Higher mobile speech quality
- Higher mobile data speed
- Better utilization of radio waves
- Better network capacity
