

Text API

Text API - Create fast and efficient communication via text messages

Use texts when the order is in, the package is outside the door or to communicate a message with multiple people simultaneously.

Why use texts?

Text messages have a higher reading frequency than the equivalent communications via email or direct mail. Integrate our Text API into your business systems to handle large amounts of texts every day. It's fast, easy and cheaper than sending letters.

Select one or more recipients

Our Text message portal can send messages to one or several recipients. For example, with text to a specific person, you can confirm an order or notify a delivery. Want to reach out with fast information to a larger group, you can easily send a text to multiple recipients at the same time.

The right text at the right time

You can choose whether you want to send the message directly or schedule it for later, such as a reminder that expires 30 minutes before the scheduled time. The information becomes mobile and can therefore be easily picked up when and where it is needed. Something that is especially beneficial for example with discount codes or visitor information.

Customize with API

Customize the flow to suit your requirements, you can also combine the API with your surrounding systems to tailor the experience. Manage notifications, information feeds, orders, changes and additions directly through the customer's mobile. Since you choose how to implement the Text API, you can use it to send everything from a single text to posting all orders in your company.

1.1 Anrop

Klienten anropar <https://api.soluno.se/token> med http-verbet POST.

I http-huvudet måste man lägga till nyckel "Content-Type" med värde "application/x-www-form-urlencoded".

Http-kroppen ska bestå av:

grant_type=password&username=ANVÄNDARNAMN&password=LÖSEWORD

Exempelvis:

[grant_type=password&username=test@soluno.se&password=MyPassword](https://api.soluno.se/token?grant_type=password&username=test@soluno.se&password=MyPassword)

1.2 Svar

Vid lyckad autentisering erhålls svar http status 200 OK med innehållet i JSON som ser ut så här:

```
{
  "access_token": "LggpLDSKEz7n...lång rad tecken...",
  "token_type": "bearer",
  "expires_in": 15724799,
  "userName": "test@soluno.se",
  "issued": "Wed, 04 Jan 2017 16:44:49 GMT",
  "expires": "Wed, 05 Jan 2017 16:44:49 GMT"
}
```

Det är en accesstoken som är giltig i 24h och skall bifogas i http-huvudet vid anropen till de metoder man använder i Web API:t.

Manage many messages

The service has an inbox feature where all conversations can be managed at the same time in a multi-agent interface. This way you can easily handle a large amount of messages, both inbound and outbound. The appearance of the interface is adapted to resembling that in a mobile phone.
